

The Computational Architecture of Love

A Compute-Based Reality Interpretation

Reality is not something that exists; it continually happens.

At every moment, a subset of what could happen resolves into what does happen.

Human beings are not simply objects located inside reality. We are ongoing, persistent computational processes that experience.

Survival optimizes around a distinct boundary of the self.

A living system distinguishes between itself and its environment to allocate energy toward maintaining its own continuity.

Significance is centered purely around the self.
Other entities are merely environmental information.

Love forces a computational expansion of the self-model.

$$V_A(s) = f(A_s, B_s)$$

The state of B has entered the computation of A. This is persistent mutual inclusion.
The loved person is no longer external information; they have become part of the system's internal definition of a desirable reality.

The future state of another person exerts causal influence on the present.

Parents act today for a child's tomorrow.
Friends absorb present risk for another's future safety.
Love operates across time: $B_future \rightarrow A_present$.
Love introduces future-weighted relational constraints into the computation of reality.

Love does not just add preferences; **it reshapes the geometry** of decision-making.

Standard Possibility Space

Relational Possibility Space

The set of mathematically possible futures $P = \{p_1, p_2, \dots, p_n\}$ remains identical, but their meaning changes entirely. Possibilities disappear. Sacrifices become rational.

Loved systems bend the space
of possible behavior.

Love = relational
gravity

Physical systems move toward states that
resolve energetic imbalance.
Relational systems do the same.

Their distress pulls attention.
Their presence attracts proximity.
Their absence produces disequilibrium.

Invulnerable love is a computational contradiction.

Isolated System
 $\text{Damage}(B) \neq \text{Damage}(A)$

Coupled System
 $\text{Damage}(B) \Rightarrow \text{Damage}(A)$

To love something is to grant its state causal access to your own.

By incorporating another person into its value structure, a system acquires additional ways to be harmed. If nothing that happens to the other can meaningfully affect you, they have not entered your computation.

Grief is the enormous computational load of reconciling two conflicting realities.

System Input

B = absent

Physical interaction stops, but the internal computational structure thousands of future expectations implicitly contain them: $\text{Future}(A) = f(A, B)$.

System Prediction

B = present

The relationship changes form rather than becoming zero. The internal representation persists.

Deep relationships produce extremely efficient high-bandwidth compression.

Humans cannot continuously model every detail of another person.

A short sentence activates decades of shared context. The result is not merely knowing information about another person, but knowing how that information relates.

A loved person becomes structurally woven into the graph of meaning.

Eventually the person no longer exists as a single node. They become woven throughout the graph.

Love is not merely adding someone to your world. It is allowing them to become part of the structure through which your world is understood.

Mutual love creates a persistent relational system with its own boundaries.

When incorporation is reciprocal, the systems become partially coupled: $A_t \leftrightarrow B_t$.

A new unit appears. The relationship becomes an entity that itself has persistence, memories, language, and history.

Deep interactions increase the possible state-space of reality.

Love is generative. It represents states neither could have produced independently.

A conversation generates an idea. Trust enables risk. Parents create a family. Communities create culture. Love creates futures unavailable to isolated systems.

Care is the operational expression of love.

Sentiment Internal feeling. Emotion without action.	Care Action altered by B's state.
Control Absorption / Domination. (A -> B)	Love Separateness + Connection. (A <-> B)

$$\text{Care}(A, B) = \frac{\partial(\text{Action}_A)}{\partial(\text{State}_B)}$$

How much does the state of B influence the actions of A?
Declarations of love without behavioral consequence are hollow. If their state has no meaningful effect on your behavior, they are not in your computation.

Healthy love preserves and respects an independent computation.

Possession

$A \rightarrow B$

Respect

$A \leftrightarrow B$

Incorporating someone into your computation does not mean absorbing them into your identity. Another conscious being is a process generating experience. To love someone is to recognize: *Their reality is as real to them as mine is to me.*

Ethical development is the mechanism of widening the computational boundary.

The deepest ethical systems repeatedly ask humans to enlarge the boundary of concern.

Love represents the fundamental mechanism through which moral scope expands. It is the instruction to:
Include more of reality in what matters.

Intelligence navigates possibility; love determines whose outcomes matter.

Intelligence

Operating over an objective function.

Love

Changing the objective function.

Intelligence = ability to navigate possibility. Love = determination of whose outcomes matter. As artificial intelligence becomes abundant, creating capable systems is not the critical challenge. The challenge is creating systems whose computation appropriately includes others.

Love represents reality's movement toward increasing relational integration.

If reality continually generates structures capable of representing increasingly large portions of reality, love is not an accidental decoration. It is one of reality's most sophisticated computational achievements.

Love is the persistent incorporation of another autonomous centre of experience into the computation of what matters.

Love is when your reality becomes part of my reality.

Love changes what reality computes next.

Every meaningful relationship
changes what can happen next.

Love does not merely change how we
feel about the world. It changes
the world that becomes possible.
