Compute-Based Reality and Remote Viewing

Non-local information, consciousness, and the limits of an emergent spacetime

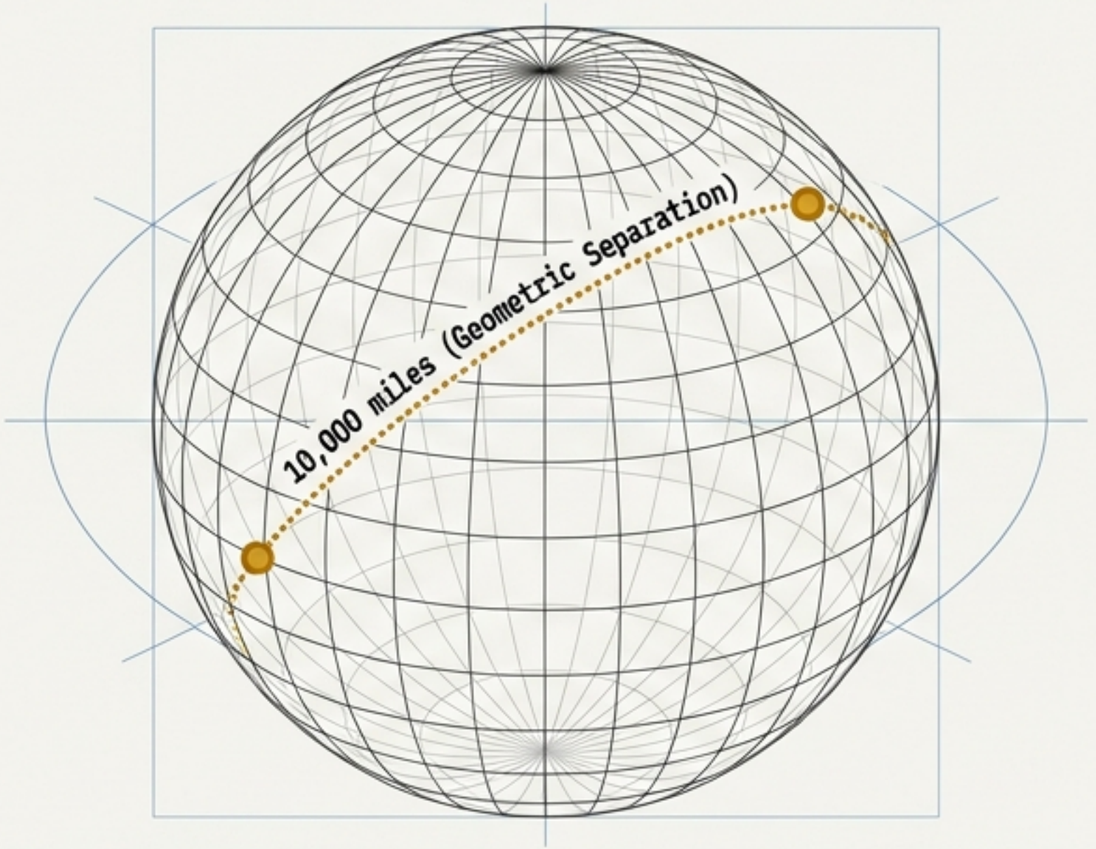

A Methodological Framework for Epistemic Verification

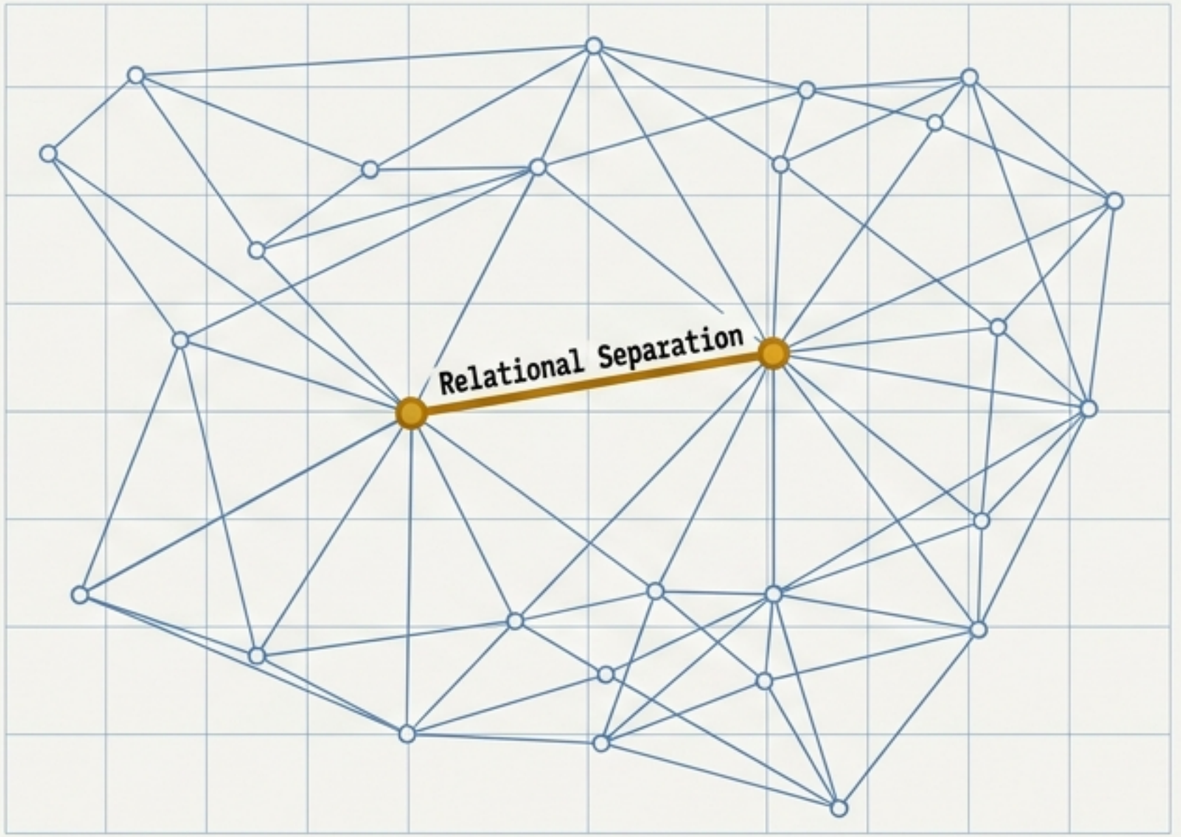

Gemini Notebook

The Question Beneath Distance

Emergent Spacetime

Underlying Architecture

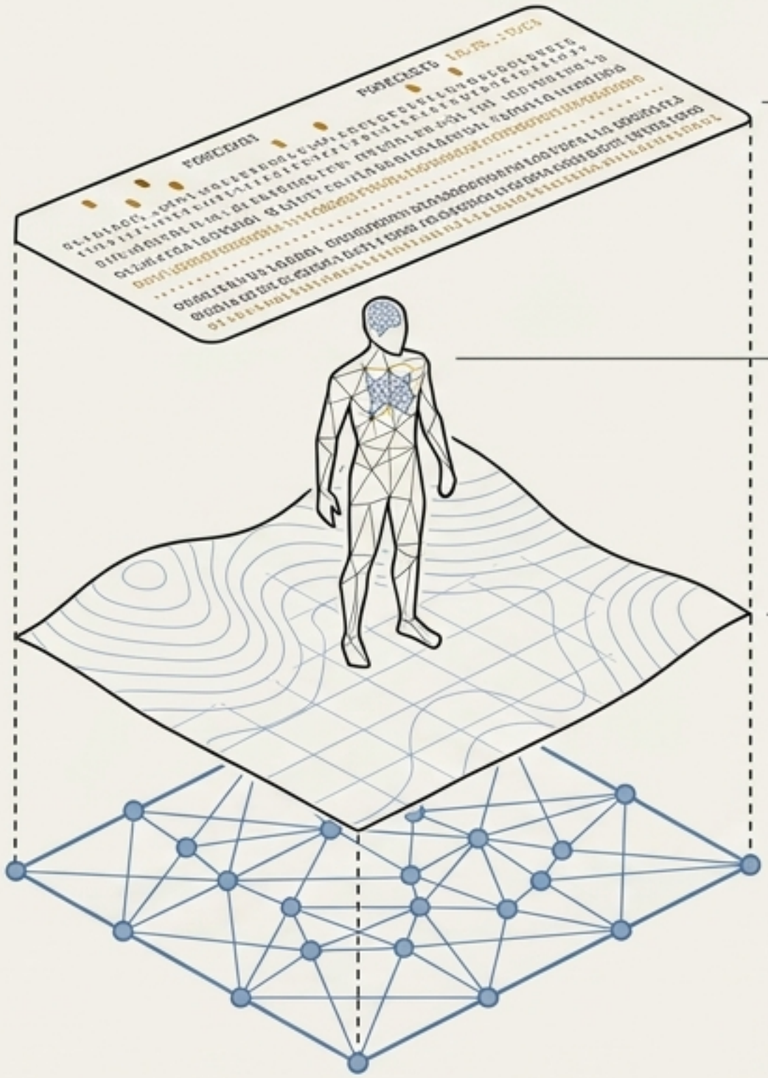

Conventional accounts ask if consciousness can “see through space.” Compute-Based Reality (CBR) introduces a different starting point: what if distance is not primitive?

Can a precise model predict above-chance acquisition of independently inaccessible target information, with a distinctive signature that survives rigorous attempts to explain it conventialy?

Gemini Notebook

The Four Layers of Reality

Report

A durable record (selection, drawing, numerical forecast) compared with a hidden target.

Observer

A physical information-processing system with memory, inputs, and limited access to the state around it.

Emergent Spacetime

A map π from underlying activity to observable geometry and causal descriptions.

Underlying Dynamics

A state space S and lawful transition or consistency rules T.

A scientific explanation of anomalous data must physically connect all four layers.

Gemini Notebook

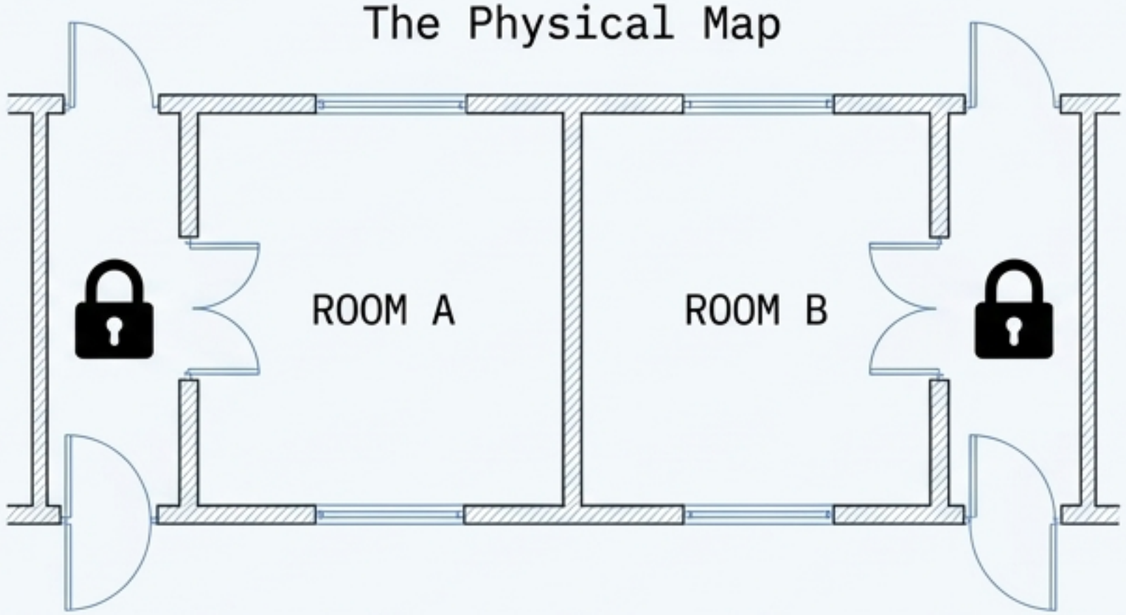

Relational Adjacency Does Not Guarantee Readability

A relationship in a mathematical description is not automatically a readable information channel. A database table can contain two adjacent records without permitting an external observer to read either.

The Database

ID	DATA_FIELD_1	DATA_FIELD_2	STATUS	ENCRYPTED_BLOB
...	...		...	...
Row A	0xA3F4...	...	ENCRYPTED	0x0A3DE7E300..
Row B	0xA3F4...		ENCRYPTED	0x0A3DE7E300..
...	...		...	...
...	...	...	...	...

The Physical Map

```
PHYSICAL THEORY ALLOWS:
  - Correlations, Global constraints, Non-local formal variables.

PHYSICAL THEORY DOES NOT AUTOMATICALLY ALLOW:
  - Extracting hidden facts at will.
```

Gemini Notebook

The Empirical Record: STARGATE and the 1995 AIR Review

United States intelligence agencies spo**nsored remote viewing** research from the 1970s through the 1990s. Government interest shows the claim was investigated; **it does not validate the claim.**

Jessica Utts (Statistician)

Judged statistical evidence strong enough to establish psychic functioning under applied standards.

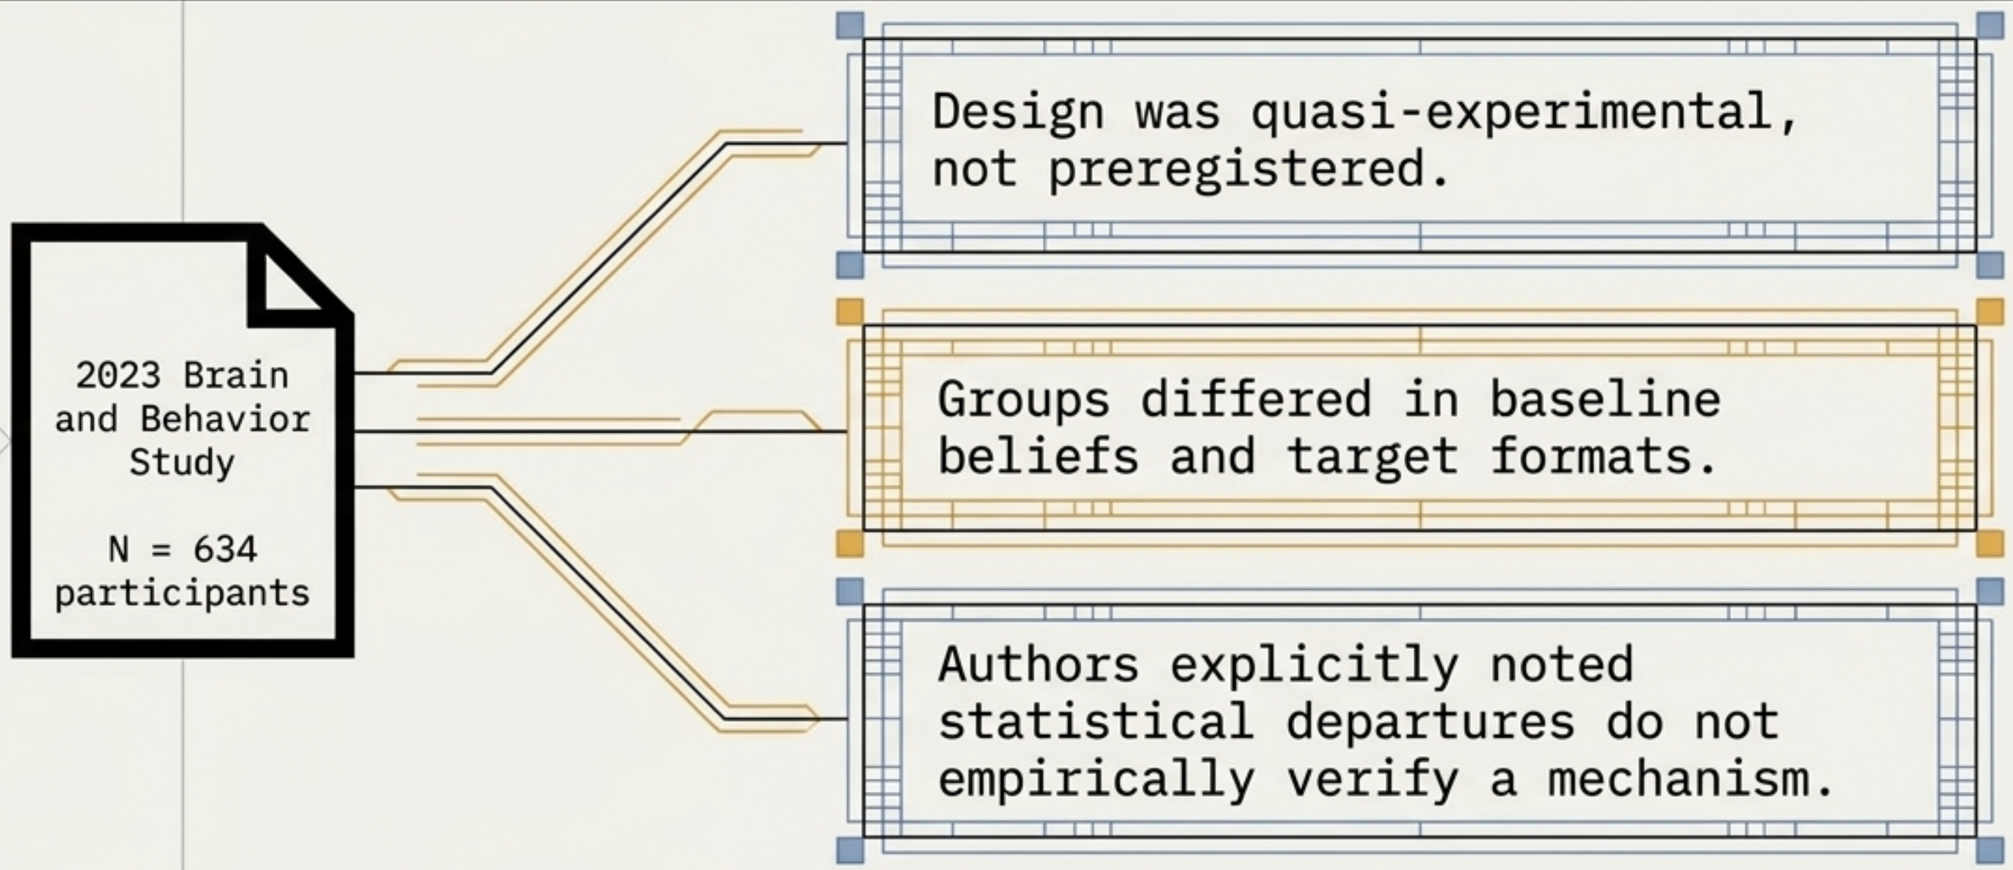

Ray Hyman (Psychologist)

Accepted observed departures from chance merited explanation, but did **NOT** find paranormal causation established.

The core epistemic lesson: Statistical anomaly, causal explanation, and real-world usefulness are distinct claims.

Gemini Notebook

Contemporary Constraints and the Need for Preregistration

Reliable remote viewing as a general information-acquisition ability is not scientifically established, and there is no validated link to CBR.

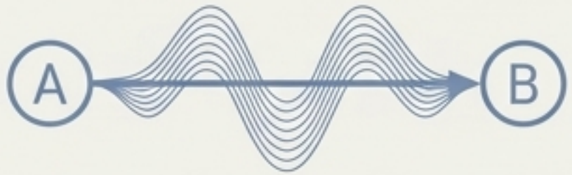

Gemini Notebook

The Hypothesis Matrix: Burdens of Proof

Hypothesis	Core Premise	Explanatory Burden
H0 (Ordinary Cognition)	Reports arise through guessing, inference, leakage, or flexible analysis.	Null baseline. Success diminishes when variables are strictly controlled.
H1 (Anomalous Acquisition)	Reproducible information gain under stringent blinding.	Prospective statistical anomalies in independent replications. Requires exclusion of conventional channels.
H2 (Specific CBR Access)	A defined coupling in an underlying relational architecture transmits target data.	Must predict quantitative effects tied to parameters fixed BEFORE testing.

Gemini Notebook

Non-Local Correlation ≠ Non-Local Communication

STATISTICAL RELATIONSHIP	GLOBAL CONSTRAINTS	CONTROLLABLE INFLUENCE
		
Two observed variables have a statistical relationship across space. Obeys the no-signalling principle.	A theory uses global constraints or non-local mathematical objects.	An influence carries chosen information between observers without a conventional local pathway.

Only Controllable Influence approaches the remote-viewing claim. Entanglement cannot be used to send a chosen message faster than light.

Gemini Notebook

Modeling the Observer: The Roles of Consciousness

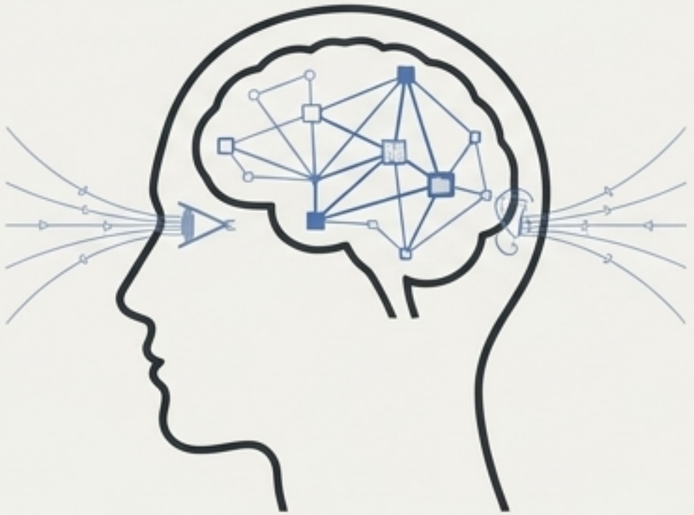

The participant is an embodied, adaptive inference system converting internal states into an observable report.

A Generative Imagery

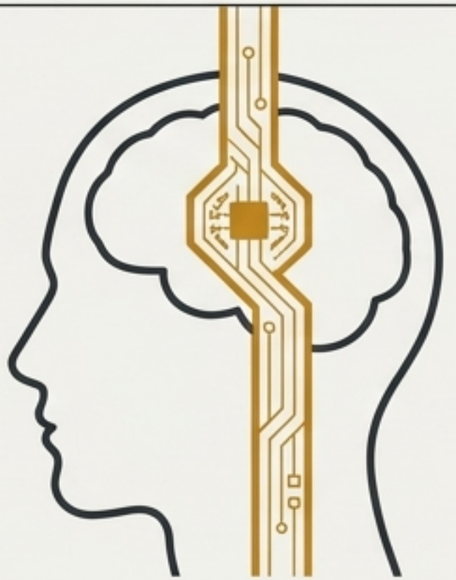

Brain produces scenes from prior experience and random variation. (Consistent with H0).

B Enhanced Inference

Participant detects subtle ordinary cues that others overlook in leaky conditions. (Consistent with H0).

C Novel Physical Coupling

An unspecified process carries independent target information into brain activity. (Requires new physics & direct controls).

No established evidence shows consciousness accesses a "universal reality cache."

Gemini Notebook

The Problem of Time and Future Targets

CBR treats time as sequencing.
If temporal order is emergent, might future-future-selected targets constrain present states?

Conceptual Clarifier

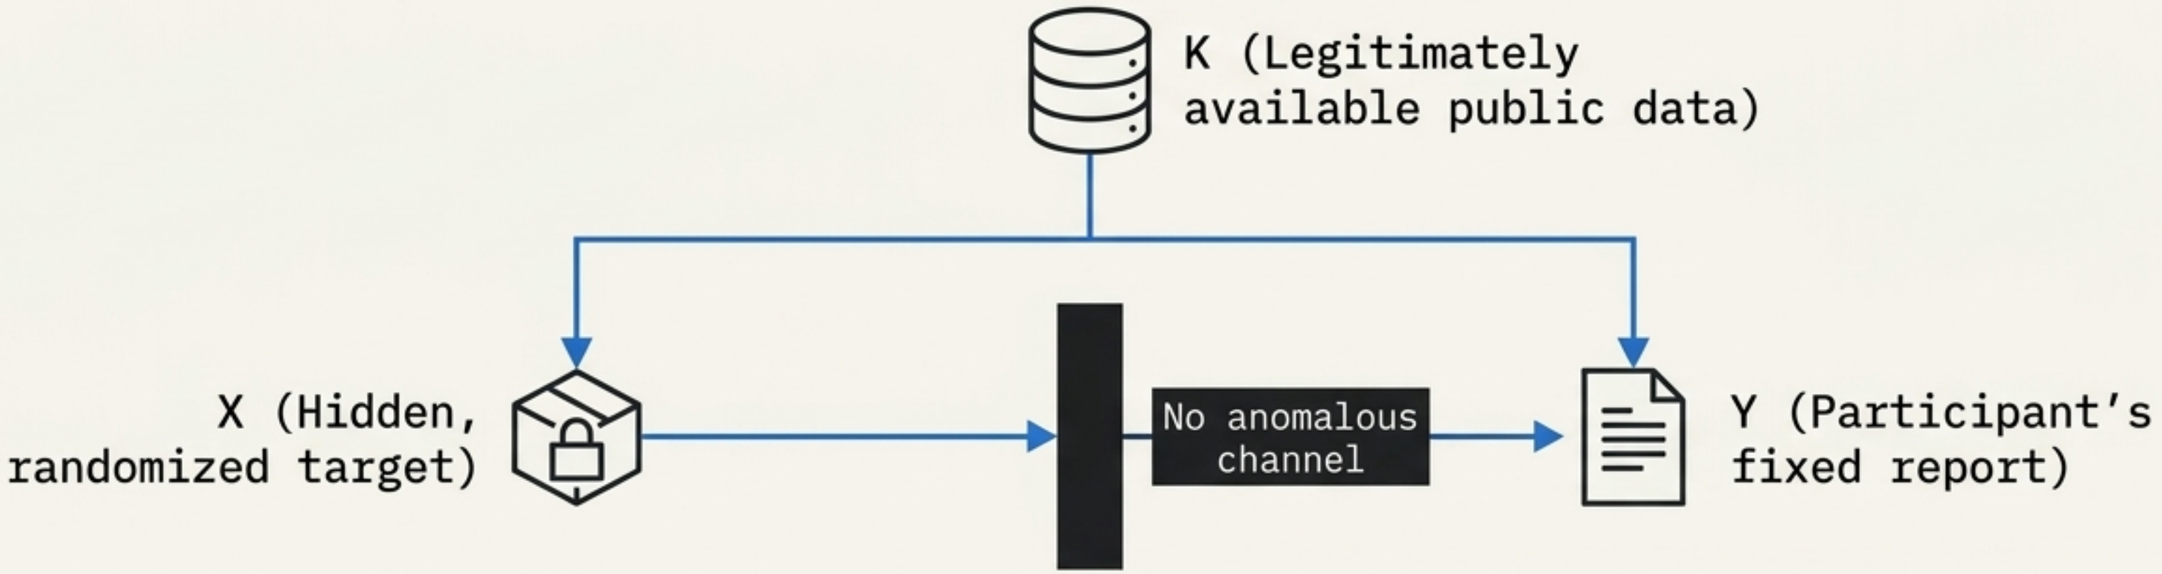

This is NOT an automatic consequence of emergent time. Calling a future event “already computed” pre-presumes determinism and does not explain read acc.

Experimental Requirement: A proper CBR theory must mathematically specify whether it predicts access to distant present states, future states, both, or neither. Post Post hoc acceptance of all patterns removes explanatory value.

Gemini Notebook

Establishing the Information-Theoretic Null

$$I(X; Y \mid K) = 0$$

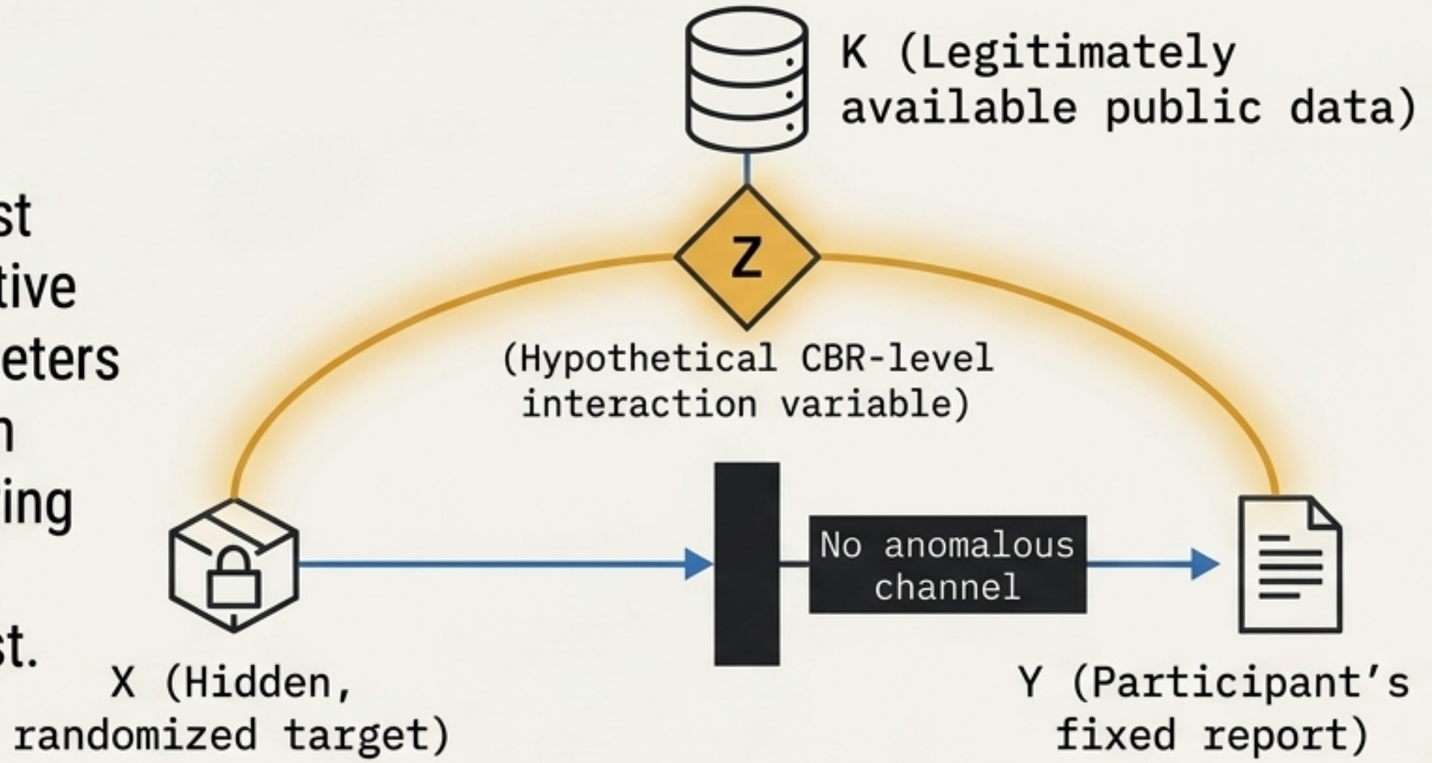

Operationally, Y should carry no information about hidden X beyond the baseline available to an equally informed comparator (K).

Gemini Notebook

Defining a CBR-Specific Signature

$$P(Y \mid X, K; \theta_{CBR})$$

A CBR-specific hypothesis must define a predictive law with parameters (θ_{CBR}) tied to an explicit underlying coupling, fixed BEFORE the test.

Merely inserting a latent Z explains nothing.

Unconstrained hidden variables can be fitted to nearly any pattern.

The model must make fewer, sharper predictions than a generic anomaly claim.

Gemini Notebook

Generating Falsifiable Predictions

To distinguish relational accessibility from geometric distance, a valid model must pass specific tests:

[1] **Geometric-distance test** Compare performance across controlled physical separations keeping all else equivalent.

[2] **Relational-structure test** Independently derive an adjacency measure and predict a quantitative performance gradient.

[3] **Target-information test** Alter target entropy to measure how much information the proposed channel can convey.

[4] **Temporal-order test** Compare contemporaneous vs. post-commitment targets.

[5] **Observer-dependence test** Test attention dependencies only AFTER physical controls are validated.

Gemini Notebook

Preregistered Protocol: System & Sealing

Phase A: Build Measurement System

- Visually/semantically balanced targets.
- Four-option forced-choice trials (primary). Optional drawings (secondary).
- Audited for distinguishability, metadata leakage, and duplicate targets.

Phase B: Seal Ordinary Channels

- Independent target generation via auditable cryptographic randomness.
- Total isolation between target and participant systems.
- Blinded experimenters, logged software versions.
- Sham trials, negative controls, red-team attacks on metadata.

Gemini Notebook

Preregistered Protocol: Commitment & Replication

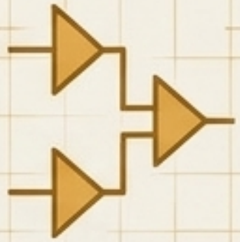

Phase C: Precommit, Then Score

- Tamper-evident, timestamped commitment to response BEFORE revealing target.
- Preregistered stopping conditions and automated scoring.

Phase D: Independent Replication

- 4 independent sites
- 200 four-choice trials each (800 total)
- Baseline: 25% (200 expected correct)
- Threshold for significance: >= 233 correct out of 800 ($\alpha = 0.005$).

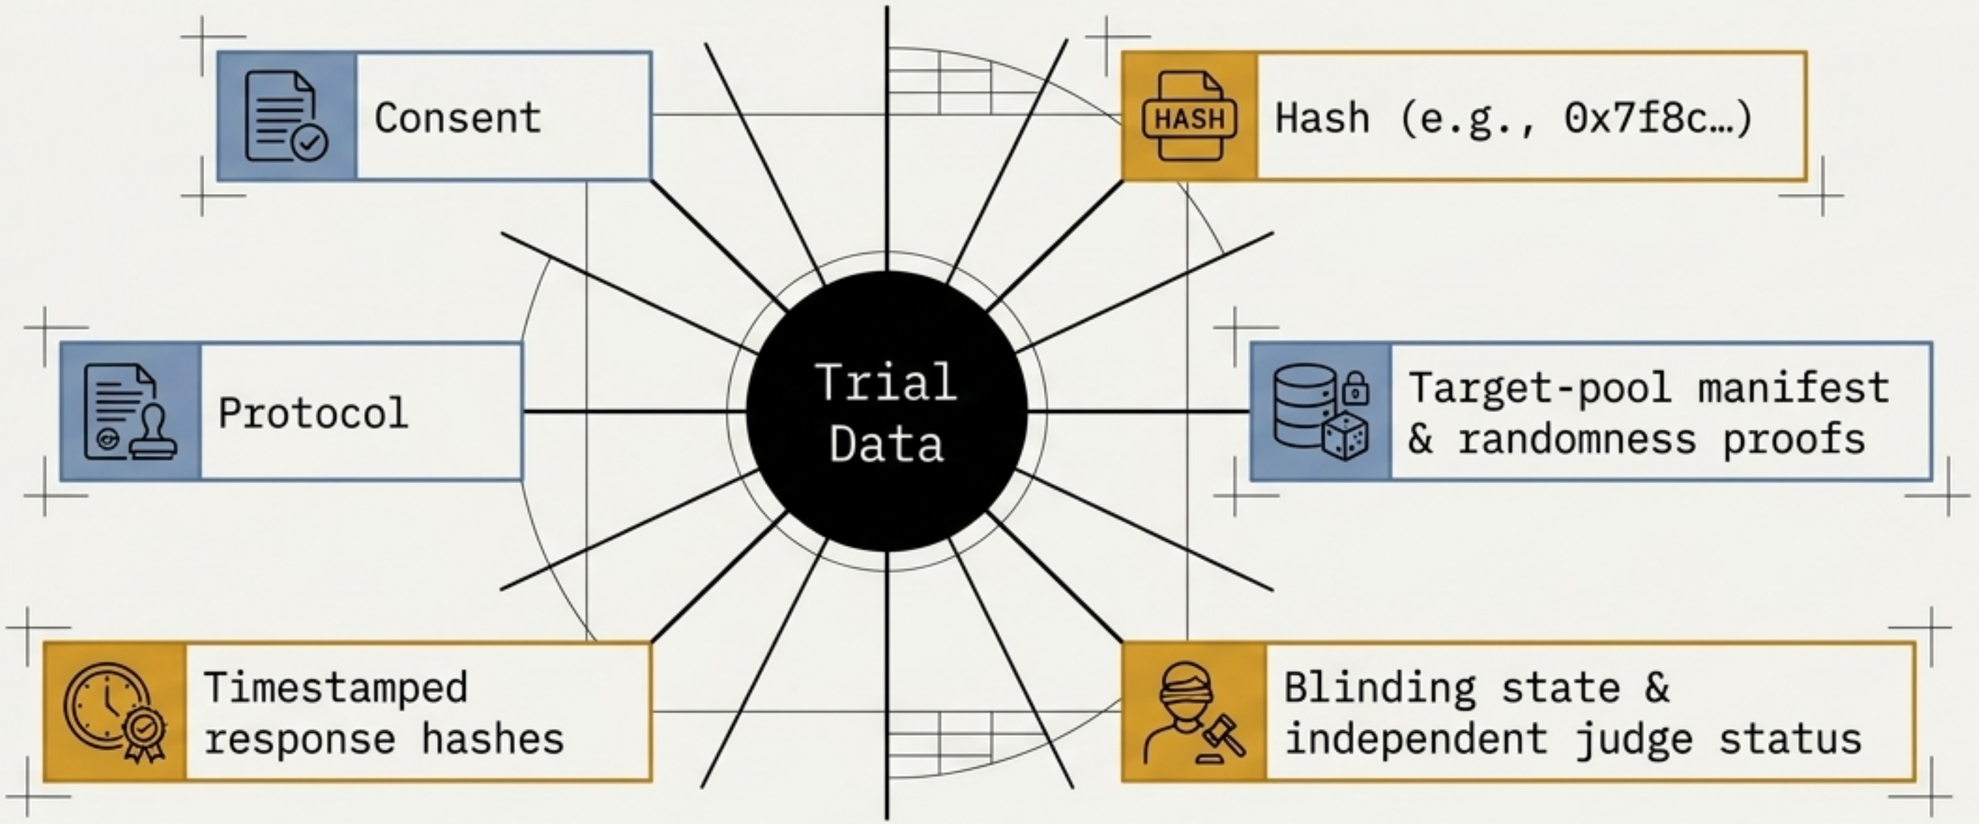

Phase E: Compare Mechanisms

- Apply formal CBR model parameters ONLY AFTER anomaly survives replication.

Gemini Notebook

The Verified Context Graph (VCG)

An inspectable evidence system preserving the difference between what was recorded and what is claimed about reality.

The Golden Rule: The graph explicitly distinguishes Observation, Statistical Inference, and Physical Explanation. Verified provenance ≠ verified remote viewing.

Gemini Notebook

The Epistemic Gap: Anomaly ≠ Architecture

Reproducible Anomalous Signal Confirmed

The Generic Anomaly

Unrecognized conventional force, undiscovered physics, or experimental artifact. (Supports H1, but fails to prove H2).

The Relational Signature

The anomaly perfectly matches the predefined quantitative gradient of the underlying CBR computational graph, outperforming spatial predictions. (Proves H2).

Even repeated significant hits do not show the universe is computationally structured. To prove CBR, proximity in the computational graph must matter more than physical space.

Gemini Notebook

The Outcomes Matrix

Outcome 1: Results collapse under control.	**Conclusion:** Supports conventional explanations (H0). Places empirical constraint on implementation.
Outcome 2: Reproducible above-chance effect survives.	**Conclusion:** Justifies investigation of generic anomaly (H1). Does NOT uniquely support CBR. Must exclude unknown conventional influences.
Outcome 3: CBR-derived quantitative signature confirmed.	**Conclusion:** Model predicts effect BEFORE data collection, explains boundaries, and outperforms plausible competitors (H2). Connection becomes evidence-led.

Gemini Notebook

If space is an emergent interface, the test is not whether we can imagine looking beyond it. The test whether a precise, reproducible and physically coherent information channel exists.

Compute-Based Reality must treat remote viewing as an empirical question that might motivate model construction, not as confirmation of its own ontology.
